Correspondence e-mail: shameed@qau.edu.pk

In the title compound, C_8H_9NS, the dihedral angle between the aromatic ring and the thioamide fragment is 36.0 (2)°. There are π-stacking interactions between coplanar aryl fragments, with a centroid–centroid separation of 3.658 (2) Å. In addition, there are intermolecular hydrogen bonds between the amino group and the S atoms.

3-Methylthiobenzamide

M.-H. Khan, S. Hameed, T. Akhtar and J. D. Masuda

Comment

Thioamides are not only important intermediates in the synthesis of heterocyclic compounds but they also possess enormous biologically activities as reported in our previous articles (Khan *et al.*, 2009a). In the present article, we report the crystal structure of 3-methylthiobenzamide, synthesized as a continuation of our previous work on the synthesis and biological screenings of five membered heterocycles (Akhtar *et al.*, 2006, 2007, 2008; Serwar *et al.*, 2009).

There are two distinct hydrogen bonding interactions between the nitrogen and sulfur atoms. The first arranges the dimer with N···S distances of 3.422 (3)Å and the second links two thioamide dimers through another N···S interaction on the order of 3.455 (2) Å. These N—H···S hydrogen bonding interactions are similar to those seen in *p*-trifluoromethylbenzothioamide where the corresponding interactions are between 3.3735Å and 3.5133Å (Jian *et al.*, 2006), in 4-chlorobenzothioamide where the N···S distances are 3.3769 (15)Å and 3.4527 (15)Å (Khan *et al.*, 2009a) and in 4-bromobenzothioamide where the N···S distances are between 3.500 (2)Å and 3.605 (3) Å (Khan *et al.*, 2009b).

Experimental

The title compound was synthesized from 3-methylbenzonitrile according to a reported procedure (Khan *et al.*, 2009a). The recrystallization of the product from chloroform afforded crystals suitable for X-ray analysis.

Refinement

The hydrogen atoms were placed in geometrically idealized positions with C—H distances of 0.93Å (aromatic C—H), 0.96Å (methyl) and 0.86Å (amide N—H) and constrained to ride on the parent atom with $U_{iso}(H) = 1.2\ U_{eq}(C)$ for aromatic and amide protons or $U_{iso}(H) = 1.5\ U_{eq}(C_{methyl})$.

Crystal data

C_8H_9NS	$F_{000} = 320$
$M_r = 151.22$	$D_x = 1.265$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 2572 reflections
$a = 7.717$ (5) Å	$\theta = 2.7$–$27.1°$
$b = 10.267$ (7) Å	$\mu = 0.33$ mm^{-1}
$c = 10.100$ (7) Å	$T = 296$ K
$\beta = 97.186$ (9)°	Block, yellow
$V = 794.0$ (9) Å^3	$0.37 \times 0.27 \times 0.20$ mm
$Z = 4$	

Data collection

Bruker APEXII CCD diffractometer	1797 independent reflections
Radiation source: fine-focus sealed tube	1447 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{int} = 0.021$
$T = 296$ K	$\theta_{max} = 27.5°$
φ and ω scans	$\theta_{min} = 2.7°$
Absorption correction: multi-scan (SADABS; Bruker, 2008)	$h = -10 \rightarrow 9$
$T_{min} = 0.793$, $T_{max} = 0.930$	$k = -13 \rightarrow 13$
6234 measured reflections	$l = -11 \rightarrow 13$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.039$	H-atom parameters constrained
$wR(F^2) = 0.112$	$w = 1/[\sigma^2(F_o^2) + (0.0556P)^2 + 0.242P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.08$	$(\Delta/\sigma)_{max} < 0.001$

1797 reflections	$\Delta\rho_{max} = 0.22$ e Å^{-3}
92 parameters	$\Delta\rho_{min} = -0.29$ e Å^{-3}
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
